Simplified Flight Simulator maintenance, Lower Maintenance Cost

Fokker 100 and Airbus A320 Flight simulators feature modular construction of the cockpit/flight deck. This means that replacement of any module can be done by any technician. Replacement of a module simply requires shipment of the module to the client.

The servers that power the flight simulator are in direct contact with EASCo.

The Fokker 100 and Airbus A320 flight simulators were developed to fill the gap between flight procedure trainers and full motion flight simulators.

The flight simulators were developed with the requirements of airline aviation training, Flight schools and type rating organizations in mind.
